

Dr. Bruce Daggy, Our New Senior Vice President, Research & Development and Chief Science Officer , opened the meeting with this statement: “*Shaklee is a group of people who believes in prevention, wellness, exercise and healthy living.*” We believe in building health!

Then he gave this fact: U.S. is far below average in life expectancy. We rank below 30 other countries, but we lead the world in technology. Something is wrong with this scene! People go to the doctor and he says, “What’s wrong with you?” Not what can I do to rebuild your health. They do not take nutrition seriously when it comes to health care. 1/3 of health care cost could be prevented just by supplementing and changing the diet.

Our products always work – we have the clinical tests to prove they work and they are backed up with the Landmark Study. We really are proud of that study and we all need to be telling people about those results. Shaklee people were all 10 years older than all the others being tested.

Our products are always safe – this is Shaklee’s biggest challenge. Do you know that there are companies that deliberately alter ingredients to hype up their products.

### **Like putting melamine in milk powder which actually killed babies. What is melamine?**

Melamine is an organic base chemical most commonly found in the form of white crystals rich in nitrogen

**What is melamine generally used for?** Melamine is widely used in plastics, adhesives, countertops, dishware, whiteboards.

### **Why was melamine added into milk and powdered infant formula**

In China, where adulteration has occurred, water has been added to raw milk to increase its volume. As a result of this dilution the milk has a lower protein concentration. Companies using the milk for further production (e.g. of powdered infant formula) normally check the protein level through a test measuring nitrogen content. The addition of melamine increases the nitrogen content of the milk and therefore its apparent protein content.

Addition of melamine into food is not approved by the FAO/WHO Codex Alimentarius (food standard commission), or by any national authorities

The contamination of milk and milk products with melamine – an industrial chemical used in fertilizers and plastics - left at least four babies dead and sickened hundreds of thousands more.

Melamine, because it is rich in nitrogen, can be used to disguise milk that has been watered-down by fooling tests for protein levels. Consumed by humans it can produce kidney stones and other potentially fatal conditions, especially in children.

That the contamination had occurred in the first place raised tough questions in China and overseas about the ethics of Chinese business practices. It was, after all, not the first such scare and dozens more have followed since..

**Why would you buy anything from China? Why would you trust what they are doing? Yet most people who buy their vitamins at Wal-Mart, Walgreens, Health Food Stores, or Brand X, are buying JUNK vitamins and minerals that are doing their bodies more harm than good.....the LandMark Study PROVES this to be true.**
